B. Crash – Electronic Records Retrieved	16

I. INTRODUCTION

A. NHTSA Report Purpose

Selected measurements within the Kansas Traffic Records System (TRS) Measurement Report (KTMR) will be submitted to the National Highway Traffic Safety Administration (NHTSA) on an annual basis. NHTSA will use the performance measurement results to assess the effectiveness of the Traffic Records Coordinating Committee (TRCC) Strategic Plan and to provide oversight of the Section 408 grant funding.

B. TRCC Report Purpose

The Kansas TRS performance measurements will enable the TRCC to make judgments about the effectiveness and efficiency of its plan, processes, and programs. The performance measurements will also provide a holistic view of the strategic plan's progress towards achieving the TRCC's goals and objectives. Kansas TRCC leaders will utilize the performance measurement results in this report to make ongoing decisions about their initiatives, processes, and performance.

Each measurement contains annual results, with trend and analysis data, and includes one of the following indicators:

Indicator	Description
	Signifies a materially positive trend in the performance measurement.
	Signifies a neutral trend in the performance measurement or
	Signifies a materially negative trend in the performance measurement.

The performance measurement summary indicates the year-over-year trend and is presented in the next section.

II. SUMMARY OF PERFORMANCE MEASURES

The state of Kansas TRCC has continued their progress towards improving traffic safety for the motoring public this year. In response to new traffic-records reviews performed this past year and the publication of the NHTSA Model Performance Measures, many of the performance measures for this reporting period have been reworked or modified.

The goal of the TRCC this reporting period was to focus on measures that help gauge where the state is focusing their efforts after the latest NHTSA traffic records review. Those areas which appeared to have the greatest need are being targeted by the updated Traffic Records System (TRS) strategic plan, which in turn makes them monitoring priorities. The following table depicts the areas which the TRCC is currently measuring in this report and those areas that are being explored in upcoming periods.

	Timeliness	Accuracy	Completeness	Uniformity	Integration	Accessibility
Crash					New	
Vehicle¹						
Driver						
Roadway						
Citation						
EMS/Injury						

Current Focus	Future Focus	Not Yet Applicable
------------------	-----------------	-----------------------

During this past reporting period one new performance measure has been added, therefore this report establishes the baseline measure and shows neither an upward or downward trend. The new performance measures introduced include:

- Crash Report – Availability and Accessibility

¹ The state is making a significant investment in a new Vehicle and Driver Licensing solution and as this project completes, the TRCC anticipates adding measures to gauge the success and adoption of that new system.

The following graph displays the overall summary of this year's metrics and the percent by which they increased or decreased from the prior year.

III. TIMELINESS MEASURES

A. Injury Surveillance – Trauma Reports Received

Trauma records, a subset of medical records for patients brought into State-certified trauma facilities, are statutorily required to be submitted to the state quarterly so that the information can be utilized at both a state and national level. While many of the hospitals have historically complied with this mandate, some have had difficulty providing this information in a timely manner.

Positive

The agency met their goal of 85% of all trauma reports received within the first 30 days and showed improvement for those reports captured in other timeframes..

During 2011, the agency met their goal of 85% and continues to progress towards its future period goals. The actual figures from CY 2009 and 2010 were used to set the initial baseline in 2010 with a goal of achieving upwards of 95% of all record submissions within 30 days of the mandated quarterly deadline. The following chart depicts the performance of the agency against this measure in the past year along with the future period goals.

B. Crash - Report Processing

Reducing the number of days required to report and process crash report data enables faster analysis of the results of TRCC programs and goals. Kansas expects to improve the timeliness of the reporting and processing of the state reportable motor vehicle crash data.

For this performance measure, processing of the crash reports refers to the submission of the crash report, initial validation and coding of the data, and the data input into the Kansas Crash/Accident Records System (KCARS) within 30 days of the crash. When processing is complete, the crash report data is available to KCARS users for reporting and analysis.

Positive

Although still behind their goal, the agency made significant progress this past year and continues to overcome difficulties new Statewide Policies and Legislation have introduced into the process.

In 2011 the agency improved six percent as they went from receiving 28% to 34% of the crash reports entered in the first 30 days. This improvement has continued into the 2012 year as they currently have well over 65% entered within the first 30 days.

This metric has been re-base-lined starting in 2011 so as to better reflect the time involved in enforcing the new State policies. The actual figures for 2008 and 2009 were used to establish this baseline.

IV. ACCURACY MEASURES

A. Crash - Blood Alcohol Content Reporting

Reporting of Blood Alcohol Content (BAC) is a required field on the statewide accident reporting form for any crash where it is suspected that one of the parties involved was in some way impaired by a substance. Ensuring that crash reports are submitted with complete BAC data (when required) will provide more accurate alcohol-related fatality statistical data for the State of Kansas and other interested parties.

 Neutral

Only 11 out of 117 Reports were lacking the BAC Content; this reflects a nominal difference from 2009. Regardless, the agency continued to surpass their target.

The goal of this measure is to decrease the number of blank or unknown BAC fields on the state crash form, which is in turn submitted to the FARS database. The following chart depicts the number of complete information provided on the state crash reports which in turn presents progress towards this goal.

In 2004, when the initial NHTSA Traffic Records Assessment was performed, inclusion of all the appropriate blood alcohol information on reports filed by officers to the state crash repository

was very low. It was determined that half of all reports were filed with incomplete information. In the coming years, the State funded a number of initiatives including additional training, improved crash report forms and automated collection tools which has brought the figure up to approximately 98% in 2009. In 2010, only 11 of the 117 alcohol-related fatality crashes were filed incorrectly.

V. COMPLETENESS MEASURES

A. Crash - Commercial Motor Vehicle Reporting

Whenever a commercial motor vehicle (CMV) is involved in a crash, officers are required to complete an additional page of the crash report providing further commercial vehicle details such as number of trailers and cargo being carried at the time of the incident.

Reporting improved significantly this past year where less than 8% of reports omitted the required commercial vehicle form.

Positive

Kansas hopes to improve the completeness of the CMV crash reports by ensuring that a Truck/Bus Supplement (KDOT Form 852) has been completed and submitted. The following diagram depicts the State's progress towards this goal.

In 2010 1,425 out of approximately 1,500 or 92% of all crashes involving commercial vehicles properly completed the required CMV form. This represents a nine percent improvement over 2009.

B. EMS - Service Participation

New for this year, the State is targeting improved participation of EMS service providers in the Statewide EMS repository and measuring improvement in this area as initiatives begin surrounding this effort. As of 2011 the State is comprised of six EMS Regional Councils and 172 EMS services throughout the State. The 172 EMS services work collaboratively with the Kansas Board of EMS (BEMS). As a collective effort to better understand and utilize patient-care information and EMS data these 172 state-wide services submit EMS reports electronically to the States EMS repository, KEMSIS, or the Kansas Emergency Medical Services Information System.

27 new EMS providers migrated over to the KEMSIS system over the past year bringing the total participation up to 41% of all service providers.

Positive

In 2011, 70 out of the now 170 EMS providers across the State are participating in the KEMSIS program. This represents 41% which is a dramatic increase over the prior year and essentially meets the 42% target previously stated by the agency. These figures can be seen in the chart below depicting the Kansas targeted and actual progress towards the KEMSIS service participation goals and expectations.

C. EMS - Reports Submitted

In an effort to better understand and utilize patient-care information and EMS data; EMS reports are being collected electronically across six regions and among 172 EMS services state-wide. After some careful consideration it has been determined that a Performance Measure for annual number of reports submitted to KEMSIS, in comparison with, the number of total EMS reports completed annually would be an accurate reflection of the States progress towards achieving its desired goals and objectives for improved EMS data capture. These reports are electronically-submitted by participating EMS services and collected in the States repository, KEMSIS, where the data and information collected can be used for analysis and information-sharing purposes.

Positive

While the total fell short of the desired target, the actual number of reports increased 15% over last year.

In 2011 96,000 out of approximately 250,000 incidents were completed and routed to KEMSIS. This represents 38% of the all EMS incidents Statewide for the year. The following chart depicts the Kansas targeted and actual progress towards the KEMSIS reporting submission goals and expectations.

As last year was the first year this metric was measured & reported, the trend was estimated based on limited information. The targets for 2012 and onward have been adjusted to better reflect the desired future trend.

VI. INTEGRATION MEASURES

A. Crash –Report Electronic Submittal

Automating crash data collection is a large emphasis of the TRS strategic plan. Automation often provides improved data timeliness and quality through an improved workflow. In this case, crash report data would be readily accessible at the KCARS database, and duplicate data entry has been substantially reduced.

Positive

In 2011 approximately 40% of the crash reports submitted to KDOT were filed electronically resulting in a 4% increase and meeting the target.

The goal measured here is increasing the number of reports submitted in an electronic format rather than the historical paper-based forms. Much of this measure is based on the TRS deployment initiative where improved data collection mechanisms will be deployed to law enforcement and a centralized record index established to facilitate collection and distribution of this electronic information.

In 2011 approximately 24,000 out of the 60,000 or 40% of the crash reports submitted to KDOT were filed electronically resulting in a 4% increase and meeting the target.

B. Crash – Agency Electronic Submittal

As discussed in the previous subsection, automating crash data collection is a large emphasis of the TRS strategic plan. Automation often provides improved data timeliness and quality through an improved workflow. In this case, crash report data would be readily accessible at the KCARS database, and duplicate data entry has been substantially reduced.

Positive

In 2011, 34 additional agencies were integrated with the state's crash repository exceeding the target by 4%.

The goal measured here is increasing the number of agencies reporting crash information in an electronic format rather than the historical paper-based forms. Much of this measure is based on the TRS deployment initiative where improved data collection mechanisms have been deployed to law enforcement and a centralized record index established to facilitate collection and distribution of this electronic information.

The number of agencies reporting crash records electronically has steadily increased over the past five years and is now beginning to surpass the initial targets. In CY 2011, 116 out of the approximately 400 or 29% of agencies who actively file crash reports are integrated to the crash reports database electronically.

VII. ACCESSIBILITY MEASURES

A. Crash – Electronic Searches Performed

For a number of years, the State’s crash reports have been preserved as both raw data and document images inside privately accessed systems within KDOT. In August of 2010, the TRS project made this rich historical record set available to the traffic safety community through the KCJIS portal hosted by the KBI.

Baseline Year

Almost 2,000 searches were performed for electronic crash reports in the first full year it was available to the traffic safety community.

This portal is used heavily by law enforcement, traffic safety and justice partners throughout the State to access various data sets such as Drivers Licensing, Vehicle Titles, and Criminal History information. The addition of crash reports to this tool makes it easy for hundreds of users to access this data point in conjunction with the other searches they already perform as a part of their daily duties. The following depicts the actual number of searches performed alongside the measure’s target figures.

This new metric has been added and targets based on a conservative increase of 25% each year however, with no real trend to use as a guide, after a second year in production it may be necessary to adjust the targets associated with this measure.

B. Crash – Electronic Records Retrieved

For a number of years, the State’s crash reports have been preserved as both raw data and document images inside privately accessed systems within KDOT. In August of 2010, the TRS project made this rich historical record set available to the traffic safety community through the KCJIS portal hosted by the KBI.

 *Baseline Year*

In its first year available via the KCJIS portal, over 600 electronic records were distributed to stakeholders.

This portal is used heavily by law enforcement, traffic safety and justice partners throughout the State to access various data sets such as Drivers Licensing, Vehicle Titles, and Criminal History information. The addition of crash reports to this tool makes it easy for hundreds of users to access this data point in conjunction with the other searches they already perform as a part of their daily duties. The following depicts the actual number of crash records returned alongside the measure’s target figures.

This new metric has been added and targets based on a conservative increase of approximately 15% each year however with no real trend to use as a guide, after a second year in production it may be necessary to adjust the targets associated with this measure.
